Yost woodworking vise installation

I bought 10 Yost woodworking vise for about \$65 in planning to make my DIY woodworking stand. As soon as I had it in my hands, I could say that he was of high quality and was pleased to see him in action. However, he sat on the floor of my workshop for almost three months while I sourced rough sawn wood, and spent more than four weeks making an actual work desk to the point where I could connect my Yost woodworking vise. I finally stuck to it this week. I had to watch this video to make sure I didn't make mistakes. Here are 7 steps related to installing 10 Yost front vise on your work desk: Disassemble it to understand how it works Mark the position on the work desk and drill holes Cut out and prepare hardwood panels as a mounting face holder and screw the woodwork vise on your workbench Plane vise top flush with your worktop top & apply the decoration to rotate or make a handle for your vise with pins and scrap wood drill holes for bench dogs, and to make some booth dogs from some pins I managed to take pictures every step of the way, but I'm sure this guide will help you get 90% there. While this example is Yost 10' front vise, the process is pretty much the same for mounting other types of woodworking vise. Disassembly and marking 10 Yost Front Vise The first step is to separate vise to make it easier to plan, mark and measure the location where you finish installing vise. Hold the lead bolt counterclockwise to remove it. The front part will eventually be separated together with two guide bars. There are two nuts and washers that have guide bars in place. I dismantled it and reassembled it twice, make sure I realized how it works, and figure out which parts are assembled primarily for the most effective installation of my work desk. Try to visualize the finished vise in your mind and understand which part goes where the final assembly. Make & The installation of drill holes in my case, I have just finished creating my own worktop and legs for my DIY workbench. So I pressed a piece of solid maple exactly where I wanted my yost woodworking vise to be. Using the base of the vice and the sharp pencil, I traced from below three main vise holes. Since I traced the hole inside, I knew that it should be slightly larger in actual diameter. From measuring the hole based on the actual situation vise, I realized my 1x4 hard maple boards were not wide enough. I'd drill a big hole too close to the edge. So, I cut another 1 inch solid maple and laminated it into a 1x4 maple, bringing the total width to about 5 inches. Here you can observe the seam line to see what I mean. Drill a large lead screw hole with 1 Bit of Forstner, and two guide rod holes - 3/4 forstner bit. You can also use a bit of a shovel if Check your actual vise for proper measurement. Keep the holes slightly oversized. I plan to drill a few 3/4 inch holes holes my bench dog on vise front face. So, I cut out two solid maple boards of equal length and glued two pieces together, bringing the depth closer to 2 inches. Then I squeezed all the maple boards and used the hole marks to drill them all at the same time. I use Porter-Cable Forstner drillbits, which are very high quality. I had to make sure I cleared all the chips and drilled about 6/8 inches every time I hit down with my drill press. Trying to drill too deep with each press can cause a lot of heat caused by friction between the chips still caught inside the hole and the wood. My Forstner bit wasn't long enough to drill through three 1x4 pieces of solid maple in one flaw. So, I drilled about 3/4 through each hole. Then I lifted the maple and pushed a piece of plywood behind the base. I drilled all the way, and the plywood base did not allow to tear off. I was very pleased with the result. There was absolutely no tear. Make sure to drill holes too big a bit. Test installation yost woodworking vise I assembled yost woodworking vise with hard maple faces in place, and everything fits well. However, I realized that the work desk centers also needed three holes to completely close the clip. At the planning stage, I completely ignored this and simply shows how important it is to do these things step by step. I had to measure the total space needed when my Yost 10 woodworking vise was completely closed. I drilled these holes with the same Porter-Cable Forstner bits, but this time with my wireless Makita drill driver. I tested the fitted vise again and was happy with the result. Now I could close vise completely. Of course, better planning can help you avoid drilling through your table rails in the first place. Also, I took hard maple boards and leveled them with my Taytools #5 jack plane. With a freshly sharp iron, I was able to get a great finish on a solid maple without any tears. Assembling and screwing 10 Yost Front Vise Then I finished my desk leg with three coats of red paint (I love red), before installing Yost Vice back in position. I've seen people use all kinds of screws to fix the flaw, but I just used wood screws of the right size. I pre-drilled each hole and made sure the screw was short enough, so it wasn't pierced at the other end of my worktop. Then I removed two guide bars and screwed on the holders on a hard maple board. I attached a solid maple board to the countertop with three screws. I drilled each hole in advance and the counter-sinking them to recuper on the screws from the hard surface of the maple face. Then I screwed vise in front with two more screws. Vise has now been properly installed and ready for use. But here are a few more steps to make it work better. Making a Vise Flush with my worktop I put my workbench upright Try yost 10 front vise make sure it does The lead bolt was a little creaking, so I applied a little paste wax to ease friction. It worked much better with additional lubrication. I also used paste wax on guide bars. Then I planned a hard maple clip top flush with my workbench top and added a slope to vise faces using my Stanley block plane. No. 7 Stanley joint plane is best suited for smoothing a large surface, but No. 5. Jack's plane would do if that's what you got. When I was satisfied with how flat it was (it wasn't completely flat), I applied a little turned into linseed oil as a quick finish. I did not see the need to use any other type of permanent decoration, because I hope that both the table top and vise will take quite a beating. It will be necessary to re-complete several times in the next few years. Make or buy a Vise Handle You can rotate the vise handle if you have to marry. The actual internal diameter is just over 1. Size your handle up to 1, and it should be correct. You can also buy 1 pin, cut it to the required length and hand sand to fit correctly. Here are some 1 pins you can get from Amazon. You can also buy a pre-manufactured 1 vise handle from Amazon. Check the item description to make sure you get the correct diameter of Yost vise. I managed to make mine out of a few pieces of scrap wood, and was more than happy with the result. If you are interested in making one, read this step-by-step guide to turning or making your own wooden vise handle. Drilling dog holes on vise and bench bench dogs will add more fastening options to your yost woodworking vise. I bought these affordable plastic booth dogs from Amazon who needed 3/4 holes. I porter cable forstner drills. I drilled three holes in my yost vise front face and three more sets of matching parallel holes in my work desk. I didn't want to drill more holes now, as I can always do them later when needed. I will give you some tips on how to drill dog holes in the next article. Testing Yost 10 Front Vise and Bench Dogs So now that everything has been done, I cleared the mess and tested Yost 10 in front vise. It worked like a charm! Before I built my desk, I was fighting my Black and Decker Workmate while trying to plane the wood. He just didn't have the weight to stay put. With Yost 10 vise mounted on my desk, everything has changed. I was able to safely clamp the coarse sawn wood and plane from zero vibration or movement. Suddenly, using hand planes felt much easier. With bench dogs, I had even more options for larger plates. While nothing I'm building next year will be as big as my work desk, the flattening of the tabletops of small rear tables will now be much easier. Overall, I am very pleased with 10 yost woodworking vise. I hope This guide has helped you how to connect Yost Vice easily and safely. How to turn the cabinet manufacturer's vise hardware into a functional pile. I use scrap for 2x6 vice jaws. Reinforced by the work bench to support the defect if necessary. Drill holes to fit the vice screw and guide rods. Line the mounting holder to determine the location of the holes. Drill the appropriate holes in the jaws. Insert the vice bars and screw through the jaws. Push the vice through the holes of the bench to line the stationary jaw with a bench and attach it in place. Screw the mounting brackets to the bottom of the bench. Attach the sliding jaw to the vice and attach a few bench dogs. Cut the pin to a length or turn a piece of stock. Cut out the ends covers of the handle. Drill the hole to attach it to the handle. Give me a little grinding. Screw the back covers to the handle. Use the technique of wood finishing. I like Danish oil and wax. Wax.
